
Experiment – 2.2

Student Name: Deepak Saini

UID: 20BCS4066

Branch: 20BCC1

Section/Group: A

Semester: 5th

Date of Performance: 19/09/2022

Subject Name: Computer Networks Lab

Subject Code: 20CSP-342

1.Aim/Overview of the Practical

Implement VLAN for a small organization which has the following two VLANs & 1 switch and 1 router.

1. VLAN HR, with a number 10 & which can be reached via a gateway 192.168.10.0
2. VLAN HR, with a number 20 & which can be reached via a gateway 192.168.20.0

2. Task to be Done

Implement VLAN for a small organization which has the following two VLANs & 1 switch and 1 router.

1. VLAN HR, with a number 10 & which can be reached via a gateway 192.168.10.0
2. VLAN HR, with a number 20 & which can be reached via a gateway 192.168.20.0

3. Application

Requirements:

- PC
- Cisco Packet Tracer Software

4. Theory:

A Virtual LAN (VLAN) is a logical LAN. VLANs have similar characteristics of physical LANs, only that with VLANs, you can logically group hosts even if they are physically located on separate LAN segments. We treat each VLAN as a separate subnet or broadcast domain. For this reason, to move packets from one VLAN to another, we have to use a router or a layer 3

switch. VLANs are configured on switches by placing some interfaces into one broadcast domain and some interfaces into another. We'll configure 2 VLANs on a switch.

We'll then proceed and configure a router to enable communication between the two VLANs.

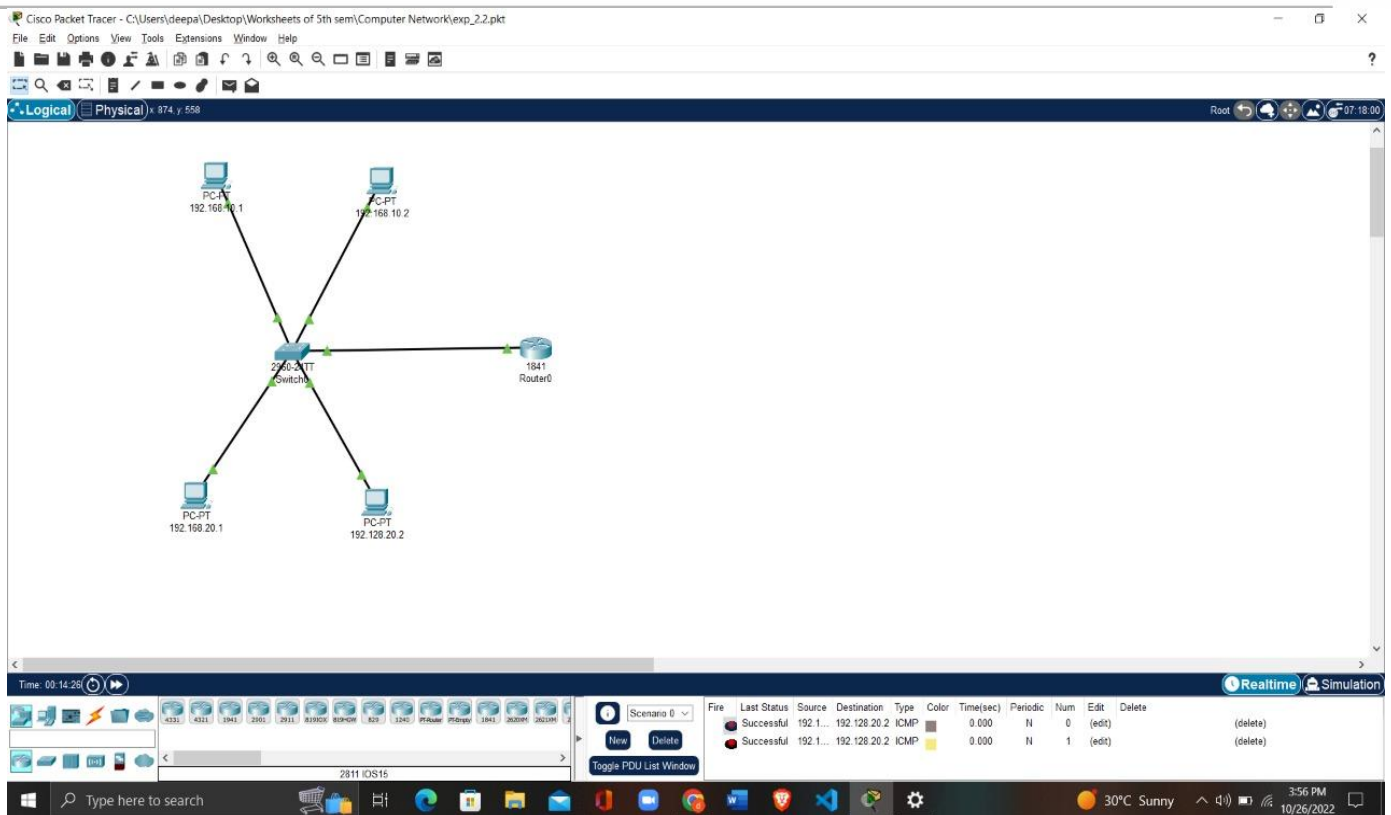

A trunk is a point-to-point link between two network devices that carry more than one VLAN. With VLAN trunking, you can extend your configured VLAN across the entire network. Most Cisco switches support the IEEE 802.1Q used to coordinate trunks on FastEthernet and GigabitEthernet.

To enable VLAN configured with trunk link to traffic frames between switches on the network, it is made possible by a link protocol called VLAN Trunking Protocol VTP.

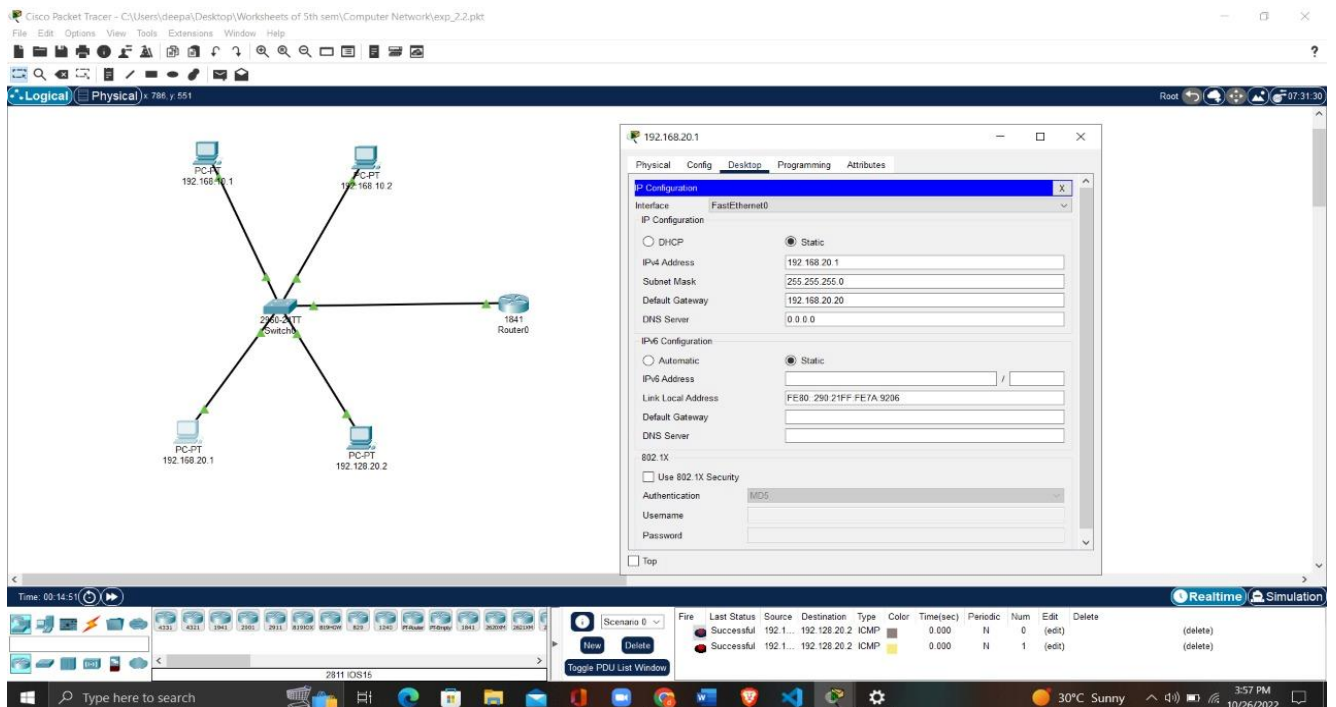

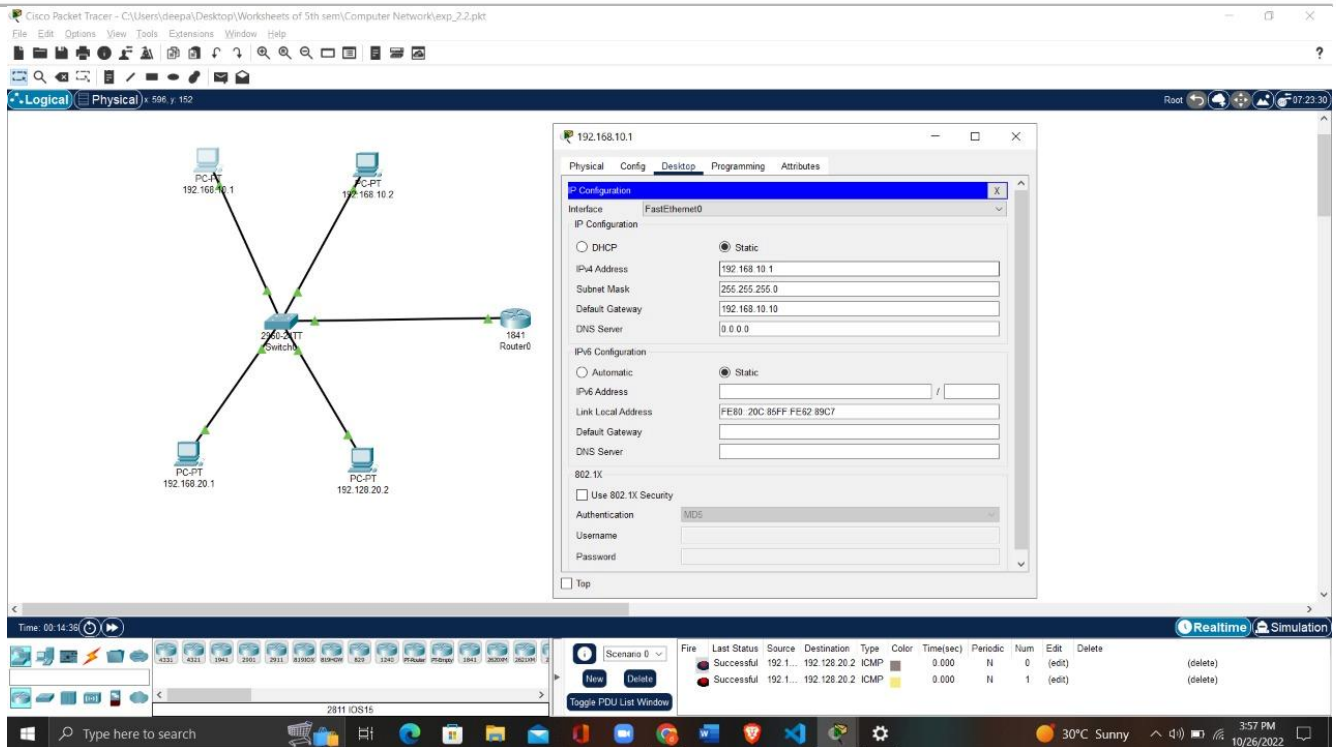

VLAN Trunking Protocol (VTP) is a Cisco-proprietary link protocol, it provides a means by which Cisco switches can exchange VLAN configuration information. In effect, VTP advertises the existence of each VLAN based on its VLAN ID and the VLAN name. VTP serves a useful purpose, It enables the distribution of VLAN configuration among switches.

5. Steps for the practical/ Result/ Output:

1. Open the Cisco packet tracer application on your PC and login with your credentials.
2. Add 4 end-devices such that each 2- different networks are created with 2 PCs each and add a Router (1841).
3. Add a switch(switch- 2960) and add those all 4 end devices to this switch using fast ethernet cable.
4. Create link between PCs-Switch and Router-Switch using the Straight-through wire selection. For each PC 1,2,3,4 select FastEthernet 0/1,0/2,0/3,0/4 respectively with their Fa0 connection. For Router select FastEthernet0/5 with its Fa0/0 connection.
5. Connect the PCs to the switch and configure their IP- addresses as in the figure such that their only host bit changes.

- Open the each PC and give the default gateways as 192.168.10.10 to 1st network PC's and 192.168.20.20 to 2nd network PC's.

7. Now for creating VLANs

- a. Create 2 VLANs on the switch: VLAN 10 and VLAN 20. You can give them names of HR and IT respectively.

Switch: Config-> VLAN Database:

VLAN Number and VLAN Name:10-> HR

VLAN Number and VLAN Name:20-> IT
respectively.

- b. Then Assign switch ports to the VLANs.

- An access port is assigned to a single VLAN. These ports are configured for switch ports that connect to devices with a normal network card, for example a PC in a network.
- A trunk port on the other hand is a port that can be connected to another switch or router. This port can carry traffic of multiple VLANs.

So, open the switch configuration panel and go to CLI tab and do the following configuration:

```
Switch#config terminal
Switch(config)#vlan 10
Switch(config-vlan)#name HR
Switch(config-vlan)#vlan 20
Switch(config-vlan)#name IT
Switch>enable
Switch#config terminal
```

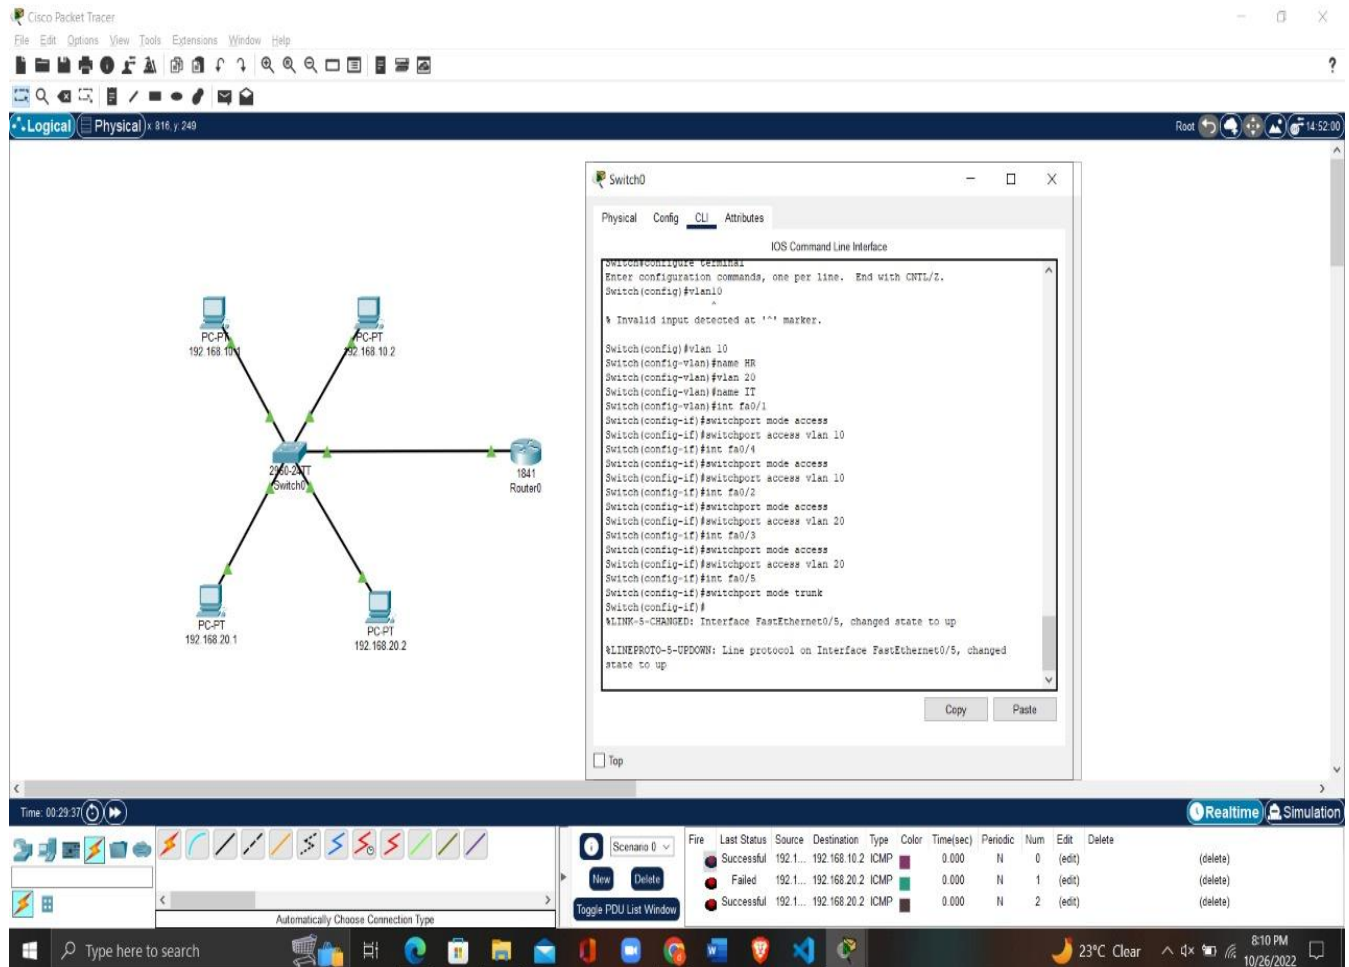

```
Switch(config)#int fa0/1
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
```

```
Switch(config-if)#int fa0/4
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
```

```
Switch(config-if)#int fa0/2
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
```

```
Switch(config-if)#int fa0/3
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
```

Switch(config)#int fa 0/5
Switch(config-if)#switchport mode trunk

The screenshot shows the Cisco Packet Tracer interface. On the left, a network diagram displays a central switch (2950-24TT) connected to four PCs (192.168.10.1, 192.168.10.2, 192.168.20.1, 192.168.20.2) and a router (1841). The right pane shows the CLI configuration for Switch0:

```
Switch0
Physical Config CLI Attributes
IOS Command Line Interface

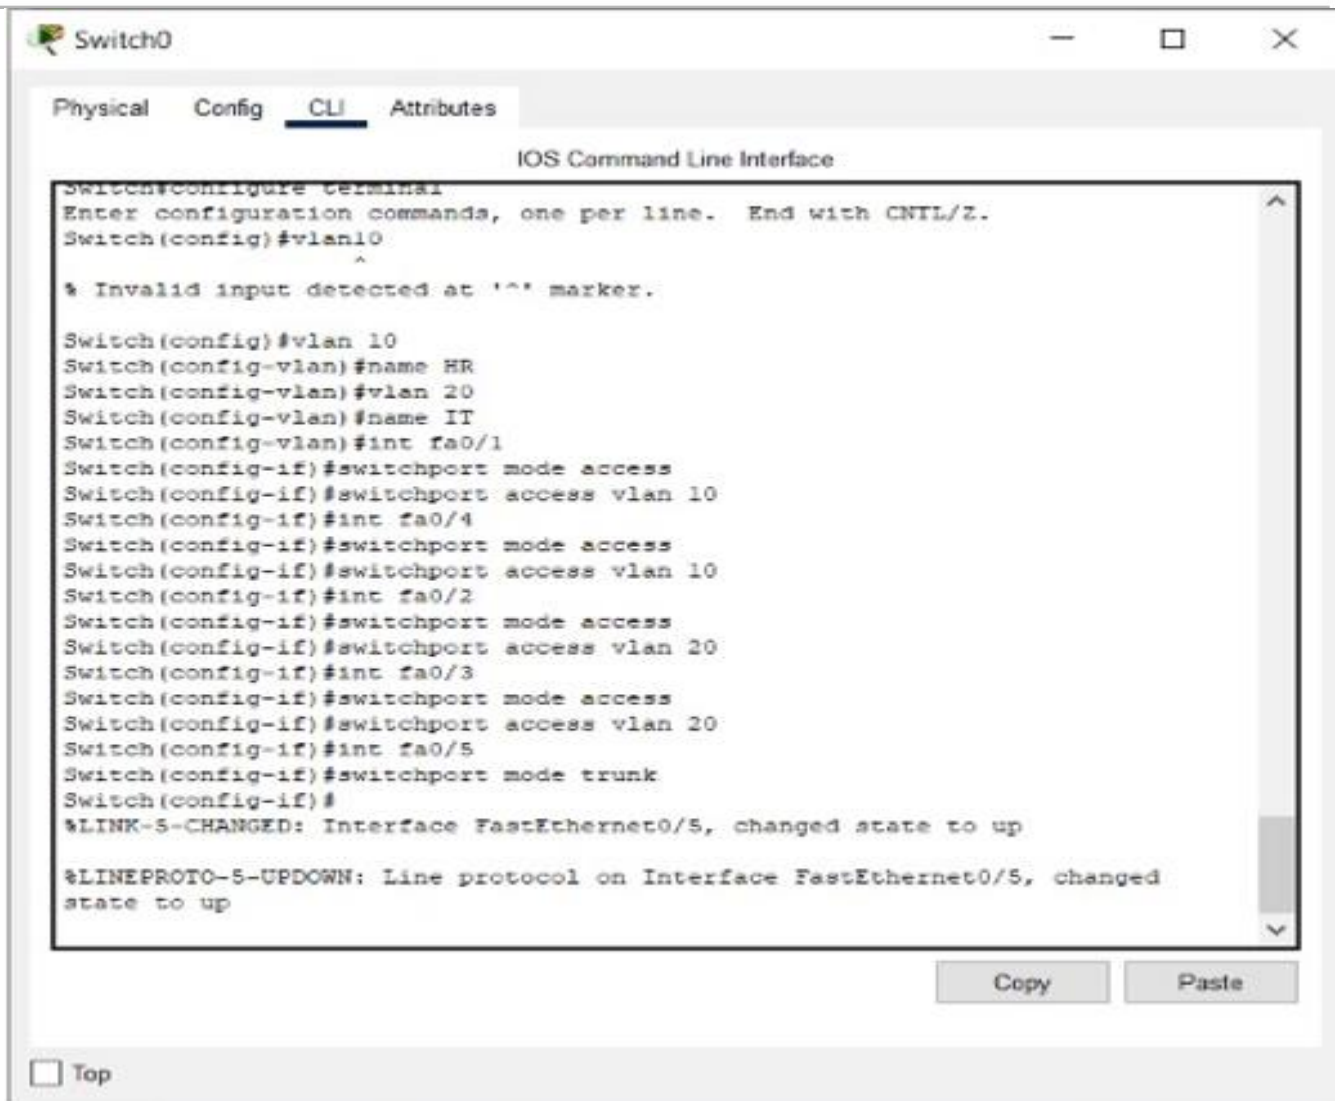

Switch(config)#configure terminal
Enter configuration commands, one per line. End with CNTL/Z.
Switch(config)#vlan10

Invalid input detected at '^' marker.

Switch(config)#vlan 10
Switch(config-vlan)#name HR
Switch(config-vlan)#vlan 20
Switch(config-vlan)#name IT
Switch(config-vlan)#int fa0/1
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
Switch(config-if)#int fa0/4
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 10
Switch(config-if)#int fa0/2
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
Switch(config-if)#int fa0/3
Switch(config-if)#switchport mode access
Switch(config-if)#switchport access vlan 20
Switch(config-if)#int fa0/5
Switch(config-if)#switchport mode trunk
Switch(config-if)#
%LINE-5-CHANGED: Interface FastEthernet0/5, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/5, changed
state to up
```

The bottom status bar shows a table of network events:

| Fire | Last Status | Source | Destination | Type | Color | Time(sec) | Periodic | Num | Edit | Delete |
|------------|-------------|--------------|-------------|------|-------|-----------|----------|--------|----------|--------|
| Successful | 192.1... | 192.168.10.2 | ICMP | | 0.000 | N | 0 | (edit) | (delete) | |
| Failed | 192.1... | 192.168.20.2 | ICMP | | 0.000 | N | 1 | (edit) | (delete) | |
| Successful | 192.1... | 192.168.20.2 | ICMP | | 0.000 | N | 2 | (edit) | (delete) | |

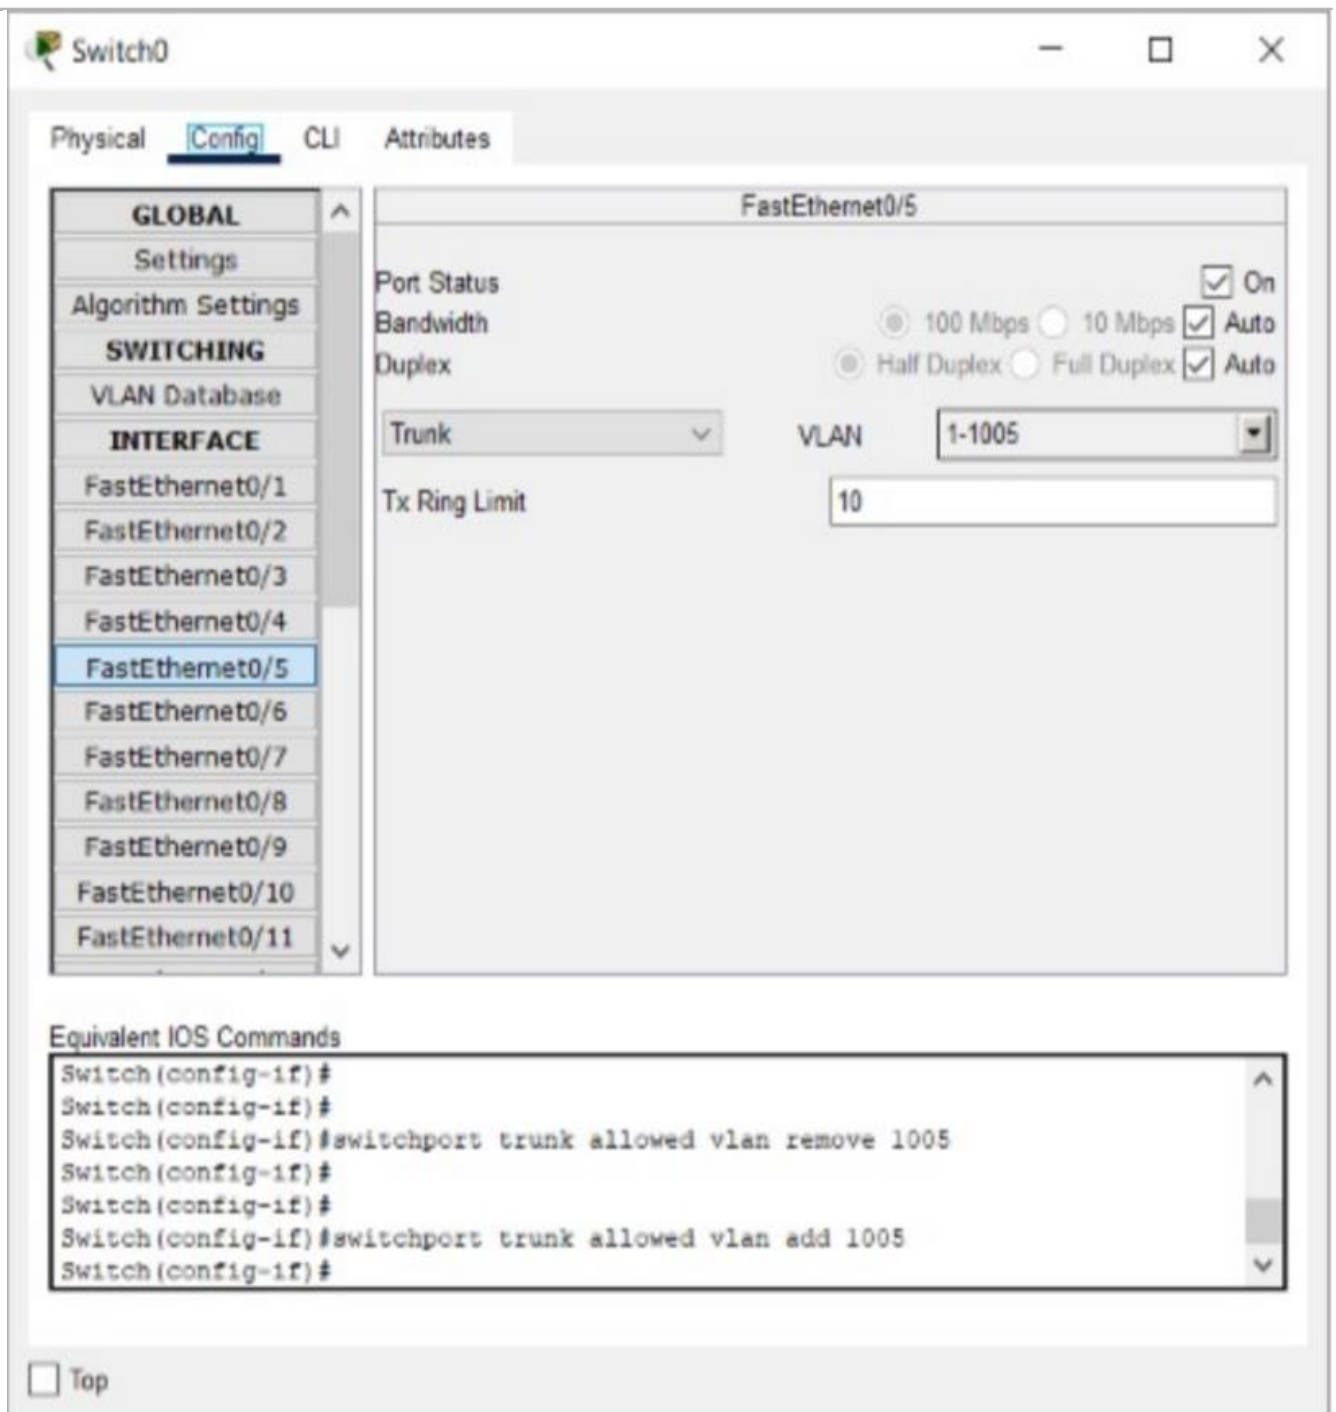

```
Switch0
Physical Config CLI Attributes

Top
```

Switch interface fa0/5 is configured as trunk port with all available (1-1005) VLAN assigned, it will be used to carry traffic between the two VLANs via the router.

The screenshot shows the configuration window for Switch0 in Cisco Packet Tracer. The 'Config' tab is selected, and the 'FastEthernet0/5' interface is chosen from the left sidebar. The configuration panel on the right shows the following settings:

- Port Status:** ☒ On
- Bandwidth:** ☒ 100 Mbps ☐ 10 Mbps ☒ Auto
- Duplex:** ☒ Half Duplex ☐ Full Duplex ☒ Auto
- Trunk:** ☐ Trunk ☒ Access
- VLAN:** 1-1005
- Tx Ring Limit:** 10

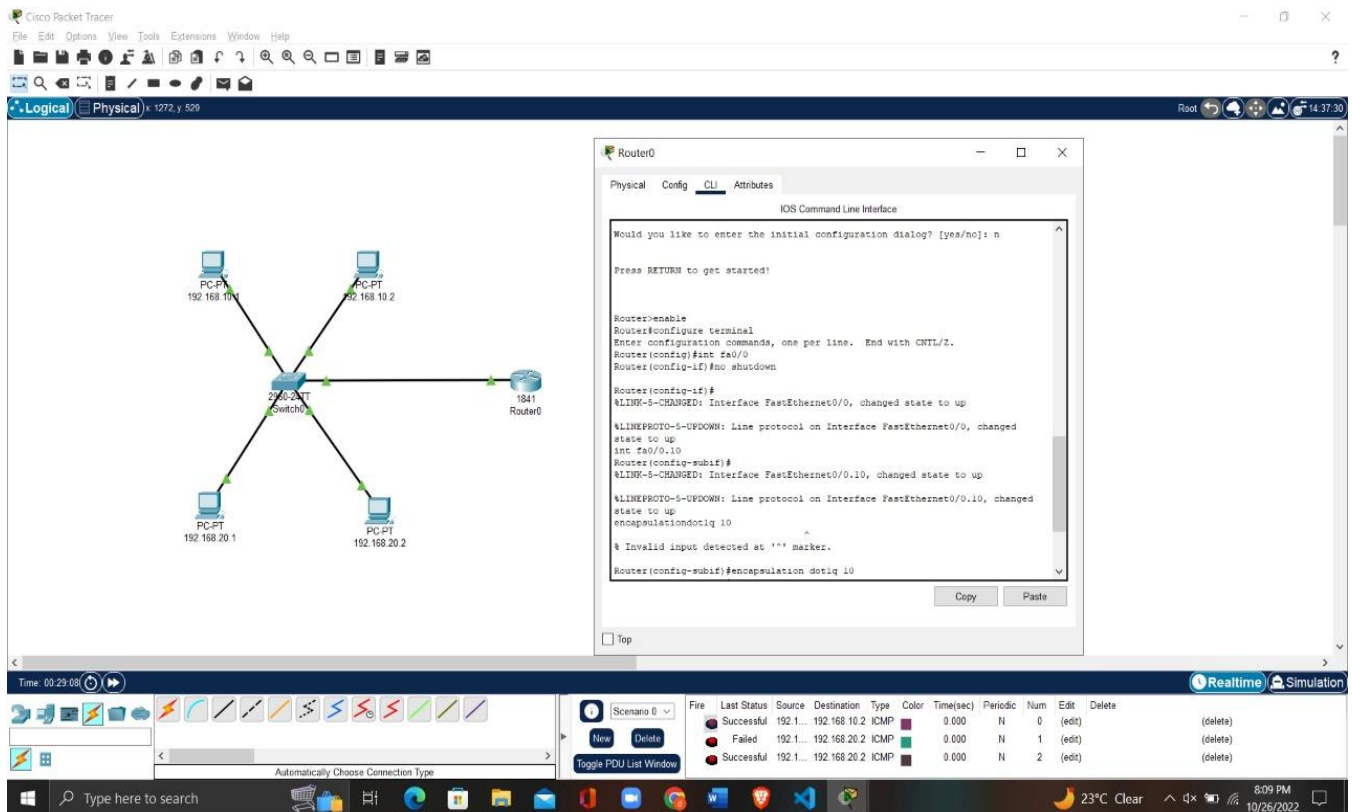

Below the configuration panel, the 'Equivalent IOS Commands' section shows the following commands:

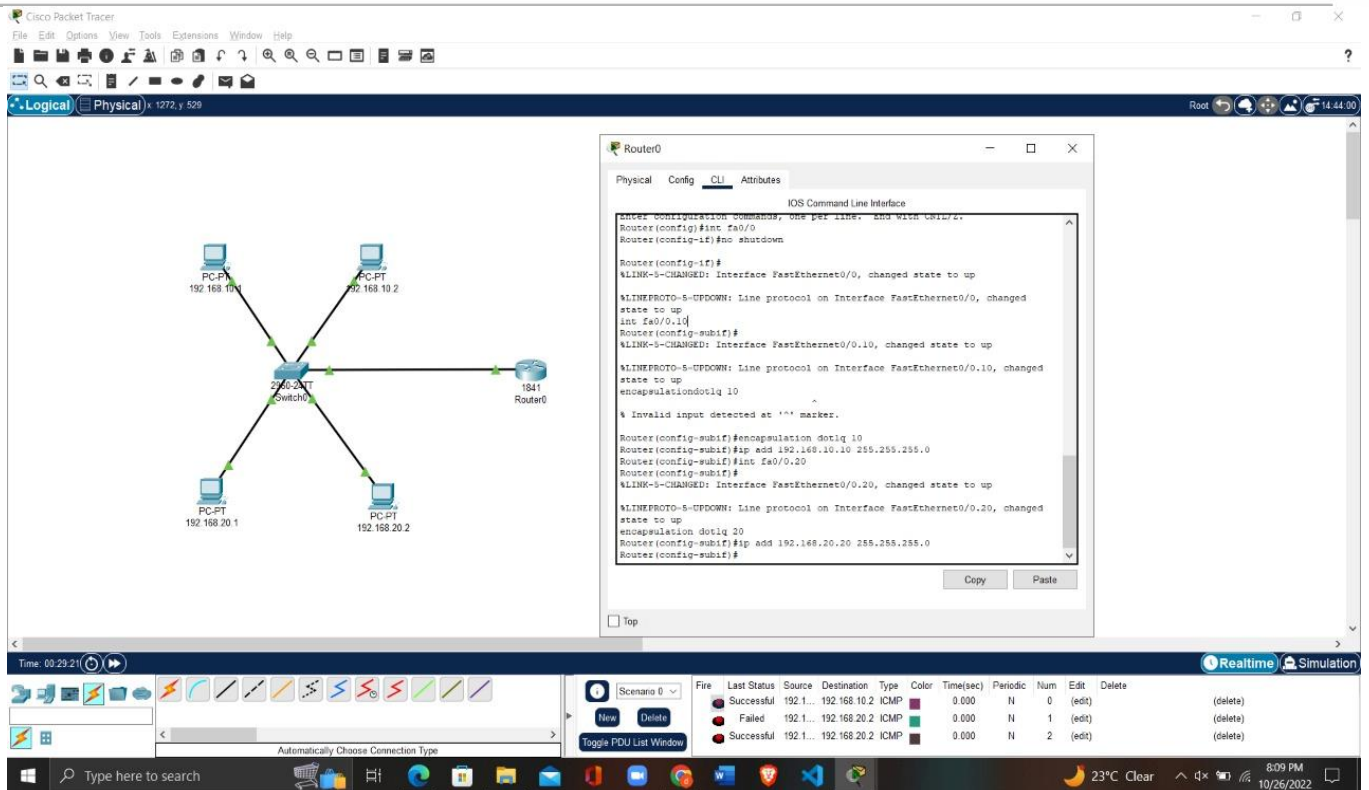

```
Switch(config-if)#
Switch(config-if)#
Switch(config-if)#switchport trunk allowed vlan remove 1005
Switch(config-if)#
Switch(config-if)#
Switch(config-if)#switchport trunk allowed vlan add 1005
Switch(config-if)#
```

At the bottom left, there is a 'Top' button.

- Now, let's configure inter-VLAN routing by opening the router configuration panel and go to CLI tab and do the following configuration:

```
Router>enable
Router#config terminal
Router(config)#int fa0/0
Router(config-if)#no shutdown
Router(config-if)#ip add 192.168.1.1 255.255.255.0
Router(config-subif)#
Router(config-subif)#int fa0/0.20
Router(config-subif)#encapsulation dot1q 20
Router(config-subif)#ip add 192.168.2.1 255.255.255.0
```

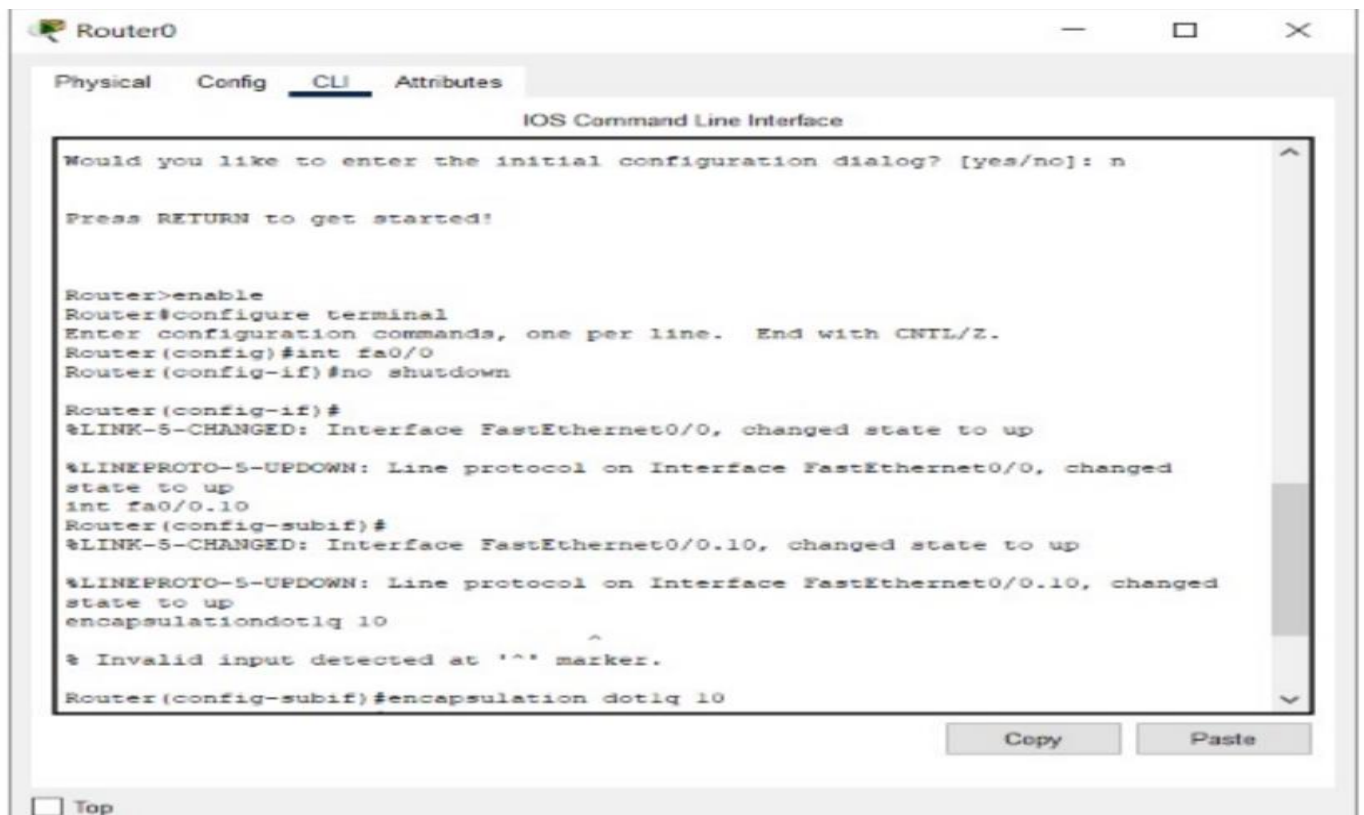

The screenshot shows the Cisco Packet Tracer interface. On the left, a network diagram displays a central 2960-24TT switch connected to four PCs (192.168.10.1 to 192.168.10.4) and a 1841 router. The right pane shows the CLI configuration for the router:

```

Router0
Physical Config CLI Attributes
IOS Command Line Interface
Enter configuration commands, one per line. End with CNTL/Z.
Router(config)#int fa0/0
Router(config-if)#no shutdown
Router(config-if)#
%LINK-5-CHANGED: Interface FastEthernet0/0, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0, changed state to up
int fa0/0.10
Router(config-subif)#
%LINK-5-CHANGED: Interface FastEthernet0/0.10, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0.10, changed state to up
encapsulation dot1q 10
^
% Invalid input detected at '^' marker.
Router(config-subif)#encapsulation dot1q 10
Router(config-subif)#ip add 192.168.10.10 255.255.255.0
Router(config-subif)#int fa0/0.20
Router(config-subif)#
%LINK-5-CHANGED: Interface FastEthernet0/0.20, changed state to up
%LINEPROTO-5-UPDOWN: Line protocol on Interface FastEthernet0/0.20, changed state to up
encapsulation dot1q 20
Router(config-subif)#ip add 192.168.20.20 255.255.255.0
Router(config-subif)#
  
```

The bottom status bar shows a table of traffic:

| Fire | Last Status | Source | Destination | Type | Color | Time(sec) | Periodic | Num | Edit | Delete |
|------------|-------------|--------------|-------------|------|-------|-----------|----------|--------|----------|----------|
| Successful | 192.1... | 192.168.10.2 | ICMP | | 0.000 | N | 0 | (edit) | (delete) | (delete) |
| Failed | 192.1... | 192.168.20.2 | ICMP | | 0.000 | N | 1 | (edit) | (delete) | (delete) |
| Successful | 192.1... | 192.168.20.2 | ICMP | | 0.000 | N | 2 | (edit) | (delete) | (delete) |

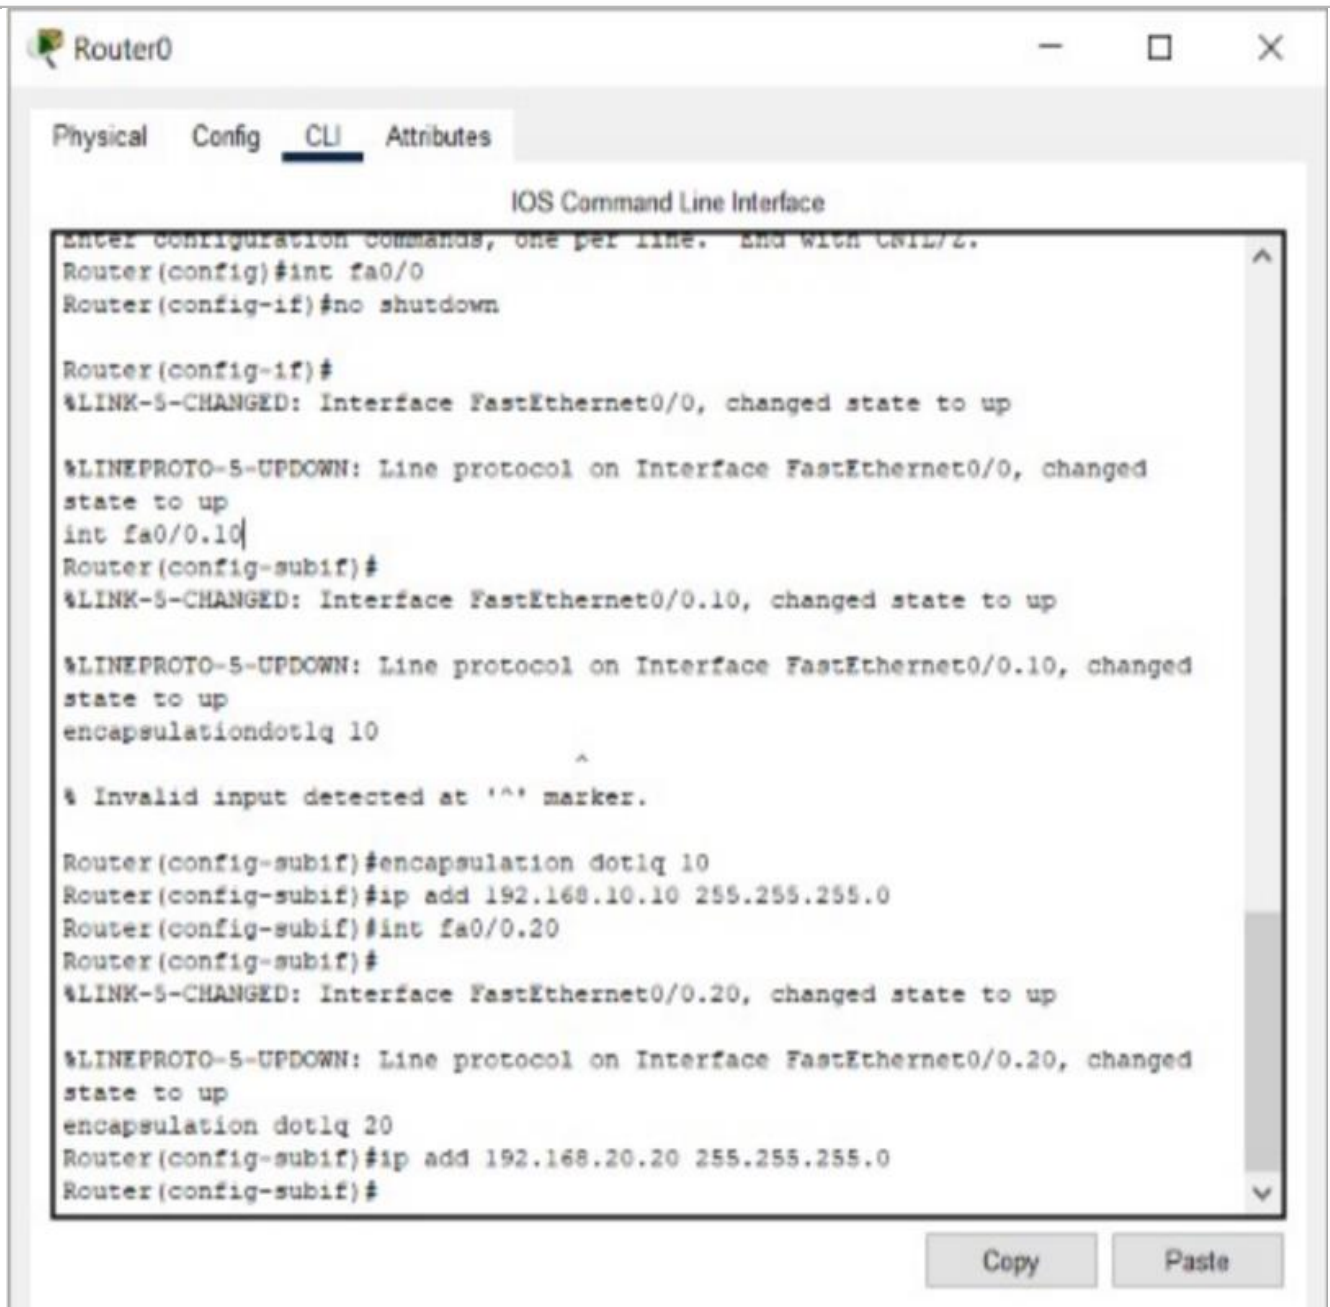

The screenshot shows the Router0 CLI interface with the following text:

```

Router0
Physical Config CLI Attributes
IOS Command Line Interface
Would you like to enter the initial configuration dialog? [yes/no]: n
Press RETURN to get started!

9. Now, finally test inter-VLAN connectivity. Ping PC1 in VLAN 10 to PC4 in VLAN 20.

The screenshot shows the Cisco Packet Tracer interface. On the left, a network diagram displays a central PC-A/T Switch connected to four PCs (192.168.20.1, 192.168.20.2, 192.168.20.1, 192.128.20.2) and a 1841 Router. On the right, a 'Command Prompt' window for PC 192.168.10.1 shows the following output:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.20.2

Pinging 192.168.20.2 with 32 bytes of data:

Request timed out.
Reply from 192.168.20.2: bytes=32 time=1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.20.2:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 3ms

C:\>ping 192.168.20.2

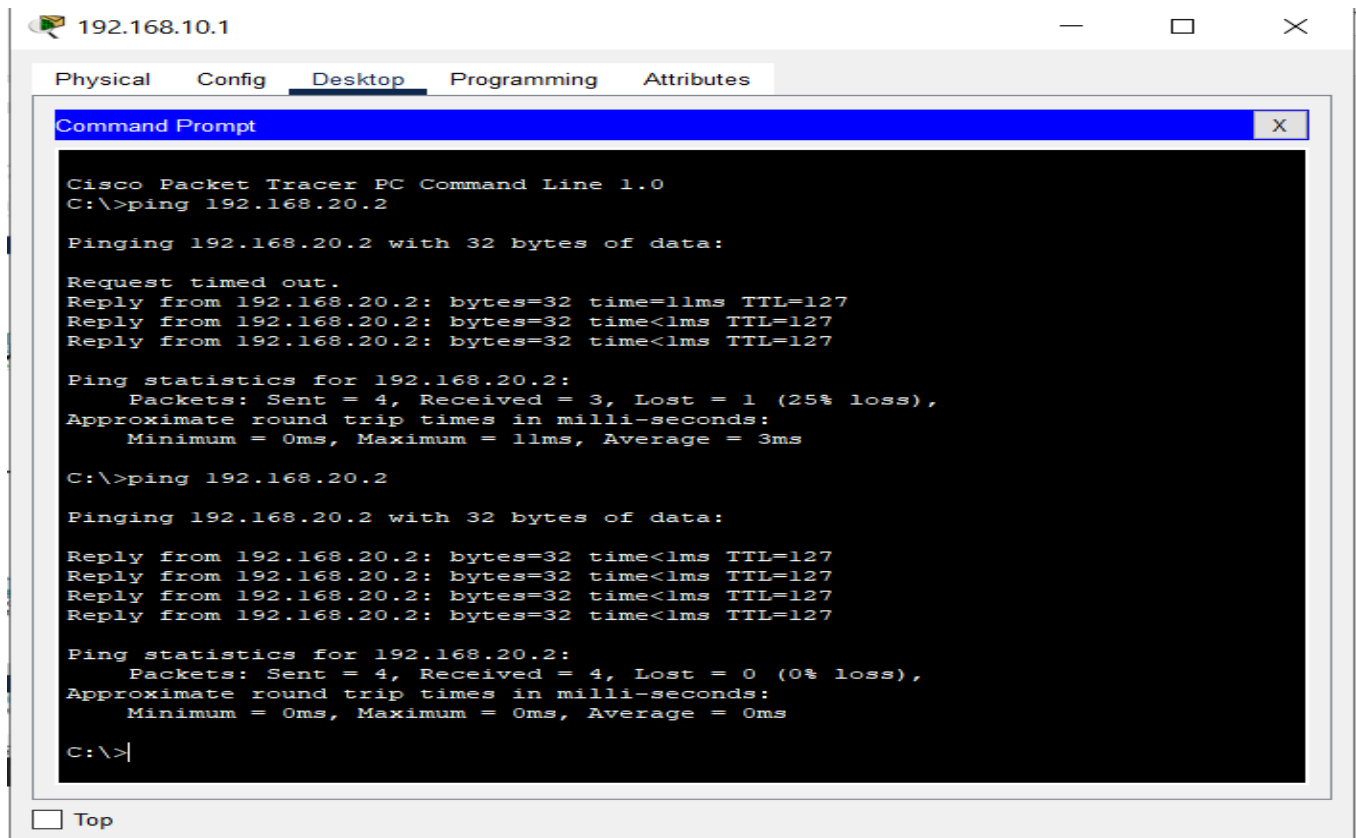

Pinging 192.168.20.2 with 32 bytes of data:

Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.20.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

The bottom status bar shows the time as 01:13:20 and the simulation is running in Realtime mode.

This is a zoomed-in view of the 'Command Prompt' window from the previous screenshot. It shows the same network diagram in the background. The command prompt output is as follows:

```
Cisco Packet Tracer PC Command Line 1.0
C:\>ping 192.168.20.2

Pinging 192.168.20.2 with 32 bytes of data:

Request timed out.
Reply from 192.168.20.2: bytes=32 time=11ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.20.2:
    Packets: Sent = 4, Received = 3, Lost = 1 (25% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 11ms, Average = 3ms

C:\>ping 192.168.20.2

Pinging 192.168.20.2 with 32 bytes of data:

Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127
Reply from 192.168.20.2: bytes=32 time<1ms TTL=127

Ping statistics for 192.168.20.2:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms

C:\>
```

The window title is '192.168.10.1' and the tabs at the top are 'Physical', 'Config', 'Desktop', 'Programming', and 'Attributes'.

Learning Outcomes:

1. To successfully understand the basic networking concepts.
2. To learn about working on Cisco Packet Tracer.
3. To build a computer network and implement VLANs.

Evaluation Grid (To be created as per the SOP and Assessment guidelines by the faculty):

| Sr. No. | Parameters | Marks Obtained | Maximum Marks |
|---------|------------|----------------|---------------|
| 1. | | | |
| 2. | | | |
| 3. | | | |
| | | | |
